Motivation and Formalia (1)

Motivation and Formalia

Welcome to this class!

Please do not hesitate to pose questions (in English or German).

Goal of This Class

- ◆ This lecture is intended as a supplement to classes in image processing such as
 - *Image Processing and Computer Vision*
(offered this semester)
 - *Differential Equations in Image Processing and Computer Vision*
(offered usually in summer terms)
- ◆ You can attend it independently on whether you already have attended, are currently attending or still plan to attend any image processing classes.

Motivation and Formalia (2)

How Can I Make Use of These Classes?

- ◆ 2 hours classroom lectures, no tutorials
- ◆ can be used in different study programmes:
 - **Visual Computing:**
 - * class in the core area visual computing, subarea image acquisition and geometric foundations (4 ECTS points)
 - **Computer Science:**
 - * advanced class (Vertiefungsvorlesung, 4 ECTS points)
 - * applied mathematics class if your minor is mathematics (3 ECTS points)
 - **Mathematics:**
 - * applied mathematics class (3 ECTS points)
 - * computer science class if your minor is computer science (4 ECTS points)

Motivation and Formalia (3)

What Prerequisites are Required?

- ◆ undergraduate mathematics (e.g. Mathematik für Informatiker I–III)
- ◆ passive knowledge of English (exam questions available in English and in German)
- ◆ knowledge in image processing or physics helpful, but not required

Grading Policy

- ◆ **Written exam: Wednesday, February 27, 2008**
Second chance: Thursday, April 10, 2008
The better grade counts.

Registration and Lecture Notes

- ◆ Please register at www.mia.uni-saarland.de/Teaching/iam07.shtml.
- ◆ You can also download the lecture notes from there (password-protected).

What is This All About?

- ◆ In image processing courses, you learn how to denoise or enhance images. But:

What do the images mean?

Which method is appropriate for a given image?

The answers are related, and depend on how images emerge.

- ◆ Our goal in this course is therefore to understand how images are generated and what they mean.
- ◆ We will discuss a broad range of image acquisition methods, whose applications vary widely, including e.g.
 - everyday photography
 - medical imaging
 - planetary remote sensing
 - astronomy
 - quality inspection.

Introductory Examples (7)

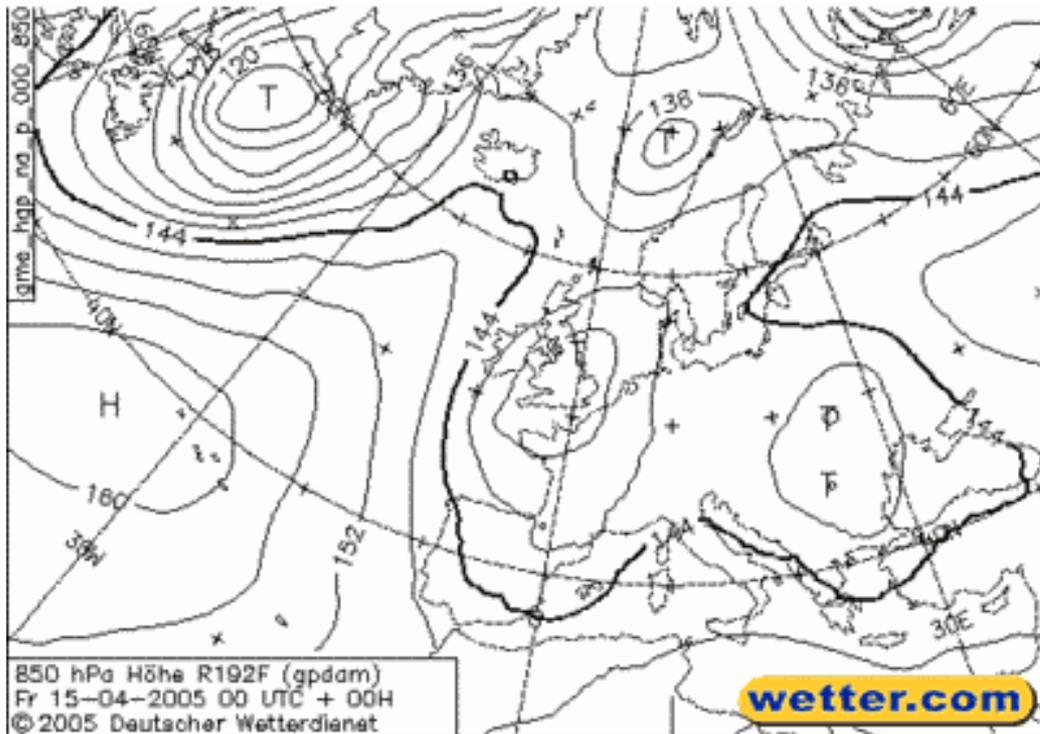

Diffusion tensor magnetic resonance image of a human head (one slice). In each voxel, a *diffusion tensor* is measured, i.e. a symmetric 3×3 matrix that indicates “mobility” of water molecules in different directions within tissue. Such images are useful in studying fibres and connectivity in the brain.

Left: Matrix entries represented in tiles of a grey-value image. **Right:** Matrices are represented by ellipsoids. (Image data: Oliver Gruber, Thomas Kamer et al., University Hospital of Saarland University, Homburg.)

Definitions

- ◆ *image*: spatial arrangement of measured data of uniform type
- ◆ *object*: physical property varying in space that is to be represented by the image
- ◆ *image acquisition*: process of measuring the data belonging to an image
- ◆ *image sensor*: measuring instrument that generates the image

Sender–Receiver Model

Transmission Channel, Direct Versus Remote Image Acquisition

- Occasionally, image data can be measured directly (such as atmospheric pressure maps). This is called *direct image acquisition*.

Only in this case, the transmission channel in the sender–receiver model consists just of the sensor.

- However, in most important cases, we adopt the view that images depict objects which are not at the same location as the image sensors. We call this *remote image acquisition*.

In this case, the transmission channel involves some *medium*, typically some sort of radiation or waves.

In this lecture, the medium of transmission is a main criterion for the systematisation of image acquisition methods.

Discretisation of Image Domain and Range (1)

Discretisation of Image Domain and Range

Object and Image as Functions

- In mathematical formalism, the object is a function

$$f : \Omega_{\text{phys}} \rightarrow R_{\text{phys}}.$$

Ω_{phys} : some domain of physical space (or space-time)

R_{phys} : co-domain; the range of values of the physical quantity

- The measured image is also a function

$$g : \Omega \rightarrow R.$$

Ω : *image domain* – some subset of the plane (or space)

R : *range* – some set of admissible values

- Neither Ω nor R are identical with their “objective” (physical) counterparts. The transformations from Ω_{phys} to Ω and R_{phys} to R are part of the transmission channel.

25	26
27	

Discretisation of Image Domain and Range (2)

Sampling

- ◆ Primarily, the object domain Ω_{phys} is thought of as a continuous domain in plane (2-D) or space (3-D).
- ◆ The domain Ω of a digital image is discrete (since only finitely many values can be measured and stored).
- ◆ *Sampling* denotes the process of reducing the continuous object domain to the discrete image domain.
- ◆ Typical choices for Ω :
 - *regular grid in space*: The data locations are arranged equally spaced in two or three dimensions. The data structure is naturally represented by an array.
 - *regular grid in space and time*: For time-variant images, time is added as an additional dimension and also sampled in equal intervals. In this case one speaks of an *image sequence*.
 - *irregular grids*: Irregular arrangements of sampling points are possible in special applications.

17	18
19	20
21	22
23	24
25	26
27	

Discretisation of Image Domain and Range (3)

- ◆ Simplifying assumption sometimes used: $\Omega \subset \Omega_{\text{phys}}$, i.e. we know exactly where the sampling points are located in physical space.
Not always true: For instance, when photographing a 3-D scene, resulting in a 2-D image, this is no bijective mapping.
- ◆ Even under this simplifying assumption, sampling may imply a loss of information:
 - Small details are lost.
 - Structures of the object may be misrepresented.

We will detail on this in the next lecture.

21	22
23	24
25	26
27	

Discretisation of Image Domain and Range (4)

Quantisation

- ◆ In most cases, also the range R_{phys} of the object function (i.e. the values of the physical property measured) is continuous.
- ◆ In digital images, the range R is discrete, since only a finite amount of information per sample is stored (e.g. one byte for representing a greyscale).
- ◆ *Quantisation* denotes the reduction of the continuous physical quantity to a discrete value.
- ◆ Typical choices for R :
 - scalars: e.g. the set $\{0, 1, \dots, 255\}$ in bitwise coded greyvalue images
 - vectors: e.g. in colour images where each of the three colour channels red, green and blue attains values within $\{0, 1, \dots, 255\}$.
 - matrices: e.g. in diffusion tensor images
- ◆ Besides the pure reduction to a discrete set of values, the mapping $R_{\text{phys}} \rightarrow R$ from physical values to image values can be nonlinear (often logarithmic or sigmoid). Linearity is a frequent but often simplifying assumption.

27	

Discretisation of Image Domain and Range (5)

- ◆ Quantisation introduces the *quantisation error*.
- ◆ Besides this, any measurement involves a *measurement error*.

Overview of Forthcoming Topics

Concept

- ◆ Next lecture: Continue with basic concepts.
 - discussion of the sampling process
 - remarks on sensor fusion
- ◆ Starting from Lecture 3, we discuss particular image acquisition methods.
 - ordering criterion: medium of transmission
 - More than half of the lectures deal with imaging using electromagnetic waves (such as visible light, X-rays, and radio waves).
 - We discuss basic methods in more detail, derived ones in short.

Planned Contents

1. **Basic Concepts**
2. **Introduction to the Electromagnetic Spectrum**
3. **Imaging with Visible Light and Nearby Ranges**
 - 3.1 2-D Visible Light Photography
 - 3.2 Optics and Camera Geometry, Light Perception, Sensorics
 - 3.3 Colour: Physics and Perception, Colour Spaces
 - 3.4 Infrared and Ultraviolet Light
 - 3.5 3-D Methods (e.g. stereography, holography)
4. **Imaging with Other Electromagnetic Waves**
 - 4.1 Micro-/Radio Waves (e.g. radioastronomy, radar)
 - 4.2 X-Ray and Gamma Ray Imaging
 - 4.3 3-D Imaging by X-Ray Tomography (e.g. CT)
5. **Magnetic Resonance Imaging**
 - 5.1 Classical MR Imaging
 - 5.2 Functional MR Imaging
 - 5.3 Diffusion Imaging (e.g. diffusion tensor MRI)
