

# What is AI

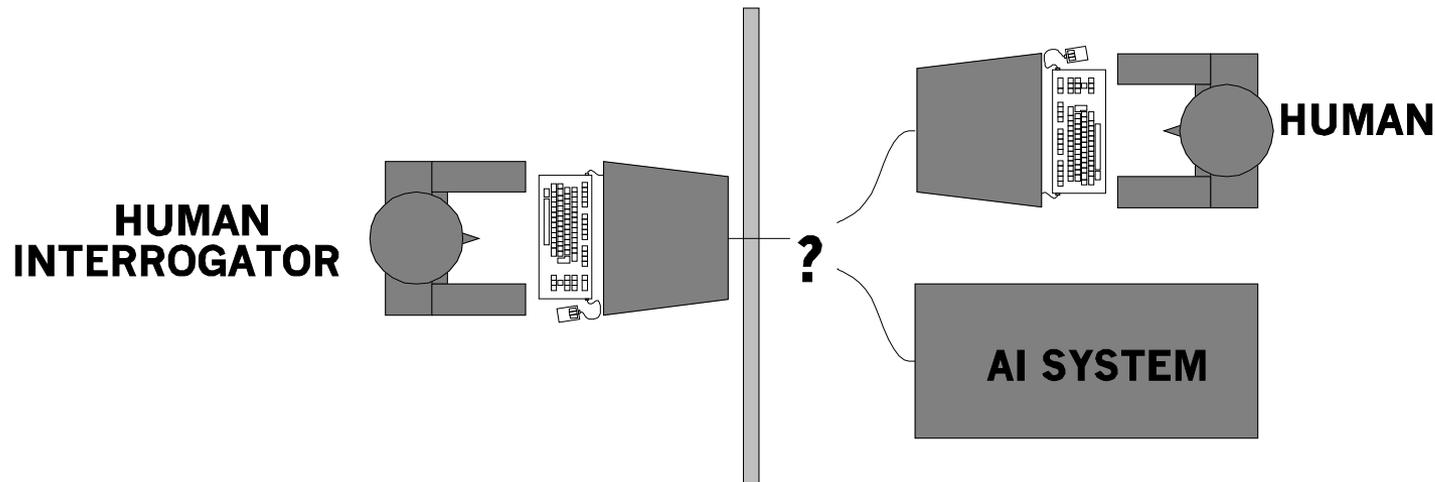

Systems that <u>think</u> like humans	Systems that <u>think</u> rationally
Systems that <i>act</i> like humans	Systems that <i>act</i> rationally

# Acting humanly: The Turing test (I)

Turing (1950) “Computing machinery and intelligence”

- “Can machines think?” → “Can machines behave intelligently?”
- Operational test for intelligent behaviour: the Imitation Game

**Problem:** Turing test is not **reproducible**, **constructive**, or amenable to **mathematical analysis**

# 1960s “Cognitive Revolution”:

Information-processing psychology replaced prevailing orthodoxy of **behaviorism**

Requires scientific theories of internal activities of the brain

- What level of abstraction? “**Knowledge**” or “**(neural) circuit**” ?
- How to validate?

Both fields (**Cognitive Science** and **Cognitive Neuroscience**) are now distinct from AI, but both share with AI some characteristics and general goals

Hence, all three fields share one principal direction!

**Saarbrücken: M.Sc in Cognitive Systems**

# Thinking rationally: Laws of Thought

Normative (or prescriptive) rather than descriptive

Several Greek schools developed various forms of logic: notation and rules of derivation for thoughts

Direct line from logic, mathematics and the philosophy of mind to modern Artificial Intelligence, Cognitive Science and Neuropsychology

## Problems:

1. Not all intelligent behavior is mediated by logical deliberation
2. Symbolic versus Subsymbolic Representation
3. Situatedness

# Acting rationally

**Rational** behavior: doing the right thing

The right thing: that which is expected to maximize goal achievement, given the available information

Doesn't necessarily involve thinking---e.g., blinking reflex--- but thinking should be in the service of rational action

Aristotle (Nicomachean Ethics):

*Every art and every inquiry, and similarly every action and pursuit, is thought to aim at some good*

# Rational Agents

An **agent** is an entity that perceives and acts

This course on AI is about designing **rational agents**

Abstractly, an agent is a function from percept histories to actions:

$$f: P^* \rightarrow A$$

For any given class of environments and tasks, we seek the agent (or class of agents) with the best performance

Caveat: *computational limitations make perfect rationality unachievable*

→ design best **program** for given machine resources

# AI: related Disciplines

- Philosophy**     logic, methods of reasoning,  
mind as a physical system  
foundations of learning, language, rationality
- Mathematics**   formal representation and proof algorithms,  
computation, (un)decidability, (in)tractability,  
probability
- Psychology**    phenomena of perception and motor control  
experimental techniques (psychophysics,  
etc.)

# AI: related Disciplines

Economics	formal theory of rational decisions
Linguistics	knowledge representation and grammar
Neuroscience	plastic physical substrate for mental activity
Control Theory	homeostatic systems, stability simple optimal agent designs

**COMPUTER SCIENCE !**

# Potted History of AI

- 1943 McCulloch and Pitts: Boolean circuit model of the brain
- 2 Turing's "Computing Machinery and Intelligence"
- 1956 Dartmouth Meeting: "Artificial Intelligence"
- 1960s Early AI programs, including Samuel's checkers program, Newell & Simon's Logic Theorist, Gelernter's Geometry Engine, ....  
→ „Look, Ma, no hands !“
- 6 Robinson's Resolution Principle for machine oriented logical reasoning
- 1970s Logic and AI

# Potted History of AI

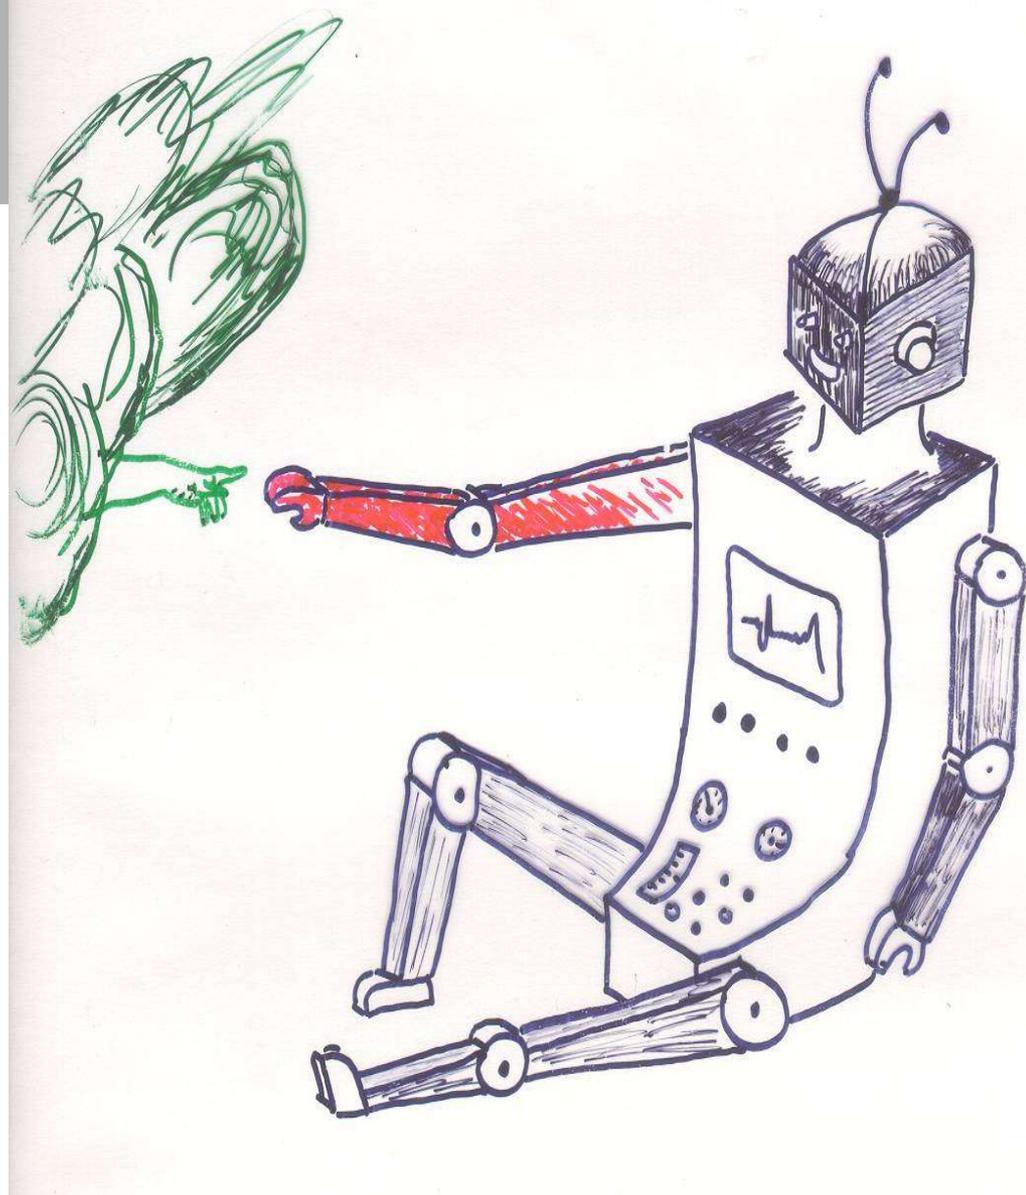

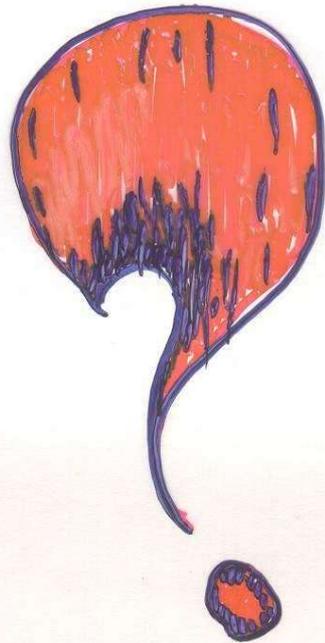

- 1965-75 AI discovers computational complexity  
Neural network research almost disappears
- 1975 Paradigm Shift: Knowledge-based systems
- 1980-88 Expert systems industry booms
- 1988-95 Expert systems industry busts: “AI Winter”
- 5 - Neural Networks new popularity: Subsymbolic Representation  
- Paradigm Attack: „Let the world be it’s own representation“  
(Rodney Brooks)
- 9 - P  
R computing
- 1995 - A
- 2000 - Fir
- COGNITIVE SYSTEMS**
- Natural Language Processing, Computer Vision, Robotics, - XPS,  
Agents and Software Engineering, Deduction Tools for - Verification,  
Multimodal Semantic Web and Knowledge  
Representation,  
- AI in ubiquitous and ambient computing  
- AI in Virtual Worlds, Games, Films and Entertainment

(17th century)

The new concept of “machine” provided by artificial intelligence is so much more powerful than familiar concepts of mechanism that the old metaphysical puzzle of how mind and body can possibly be related is largely resolved . . . Artificial intelligence, in short, cannot only acknowledge but can even elucidate the essentially subjective mental realities so stressed by humanist psychologists (as opposed to behaviorists or neurophysiologists).
